Milestone 1: Project Proposal

Link to GitHub Repo

R1 - Application high-level description

PocketTrader is a small inventory/collection manager for TCG (trading card game) collectors. The app maintains a catalog of cards (cardID, name, pack/set, rarity, type, imageURL, etc.) and allows authenticated users browse and filter the catalog, add one or more copies of a card to their personal collection, add cards to their public wishlist, and have the opportunity to find trades with other uses (i.e. identify what cards are on different users' collections and wishlist, then arrange a suitable trade, such that one or more players get cards on their wishlist). Typical users are players and collectors who want to track what they own and quickly find cards by pack, rarity, or type. Administrators are the app maintainers (us), who seed and manage the database.

As of milestone 1, we have implemented the ability to view/filter cards, and to add cards to the user's personal collection.

R2 - System support description

The frontend is built with Next.js (React) and Tailwind CSS, served on port 3000. The backend is a Flask (Python) app that exposes REST endpoints (ports: backend 5000) and executes SQL queries stored in app/backend/sql/ (one .sql file per query). The database is MySQL (5.7 in the provided Docker Compose), which holds tables like Card, User, and Collection. Docker Compose is used to orchestrate the three services (db, backend, frontend) so it runs consistently across OSes (containers run on Linux via Docker Desktop on Windows/macOS).

R3 - Database with sample dataset

We will use a Python script to fetch card metadata from the public TCGDEX Pocket API (https://tcgdex.dev/tcg-pocket). The script should normalize fields (cardID, name, packName, rarity, type, imageURL). We produce an artifact, which is a SQL seed file (e.g., app/database/migrations/init.sql) with INSERTs for Card, User, and sample Collection rows. For our sample data, we'll only include a small set of ~25 cards. When we create our full production database, we can use or extend this same script to gather ALL existing cards.

Here is our sample Card instance:

R5 - Design database schema

R5a - Assumptions

- 1. Each user has a unique user ID and username
- 2. Each Pokemon card has a unique card ID
- 3. Card rarity levels follows Pokemon TCG Pocket rarity levels (1-4 diamond, 1-2 star)
- 4. All cards have defined types (fire, water, grass, etc.)
- 5. A user can own multiple copies of the same card, tracked by a quantity field. Users can only trade cards they currently own
- 6. User can add multiple cards to their wishlist. The same card can appear on multiple users' wishlists.
- 7. A trade involves exactly 2 users and 2 cards
- 8. Both cards in trade should have the same rarity level
- 9. Trade statuses are: "pending", "accepted", "rejected", "cancelled", "completed"
 - a. Only completed trades affect user collections
- 10. When trade is completed, card quantities are automatically updated in both users' collections
- 11. Users should not be able to delete their account if they have pending trades
- 12. Date fields should use format YYYY-MM-DD HH:MI:SS

R5b - E/R diagram

(See attached PDF for a clearer picture)

R5c - Relational Data Model

User (<u>userId</u>, username, passwordHash, dateJoined)

Card (cardId, name, imageUrl, rarity, type, packName)

Trade (tradeId, dateStarted, dateCompleted, status)

Collection (userId, cardId, dateAcquired, quantity)

- PK: (userId, cardId)
- FK: userId references User
- FK: cardId references Card

Wishlist (userId, cardId, dateAdded)

- PK: (userId, cardId)
- FK: userId references User
- FK: cardId references Card

TradeParticipant (tradeId, userId)

- PK: (tradeId, userId)
- FK: tradeId references Trade
- FK: userId references User
- Check: Each tradeId must have exactly 2 rows

TradedCard (tradeId, cardId)

• PK: (tradeId, cardId)

FK: tradeId references TradeFK: cardId references Card

• Check: Each tradeId must have exactly 2 rows

R6 - Basic Feature/Functionality 1: Browse & Filter my collection

R6-a:

This feature allows users to browse and filter their cards. The user is any logged-in player.

Flow: User selects optional filters (rarity/type/text search) \rightarrow Clicking search renders a table of matching cards with quantities \rightarrow Clicking a row opens a card detail panel.

R6-b:

Query template:

```
-- :userId, :rarityOpt, :typeOpt, :packOpt, :nameSearchOpt are parameters

SELECT c.cardID, c.name, c.rarity, c.type, col.quantity

FROM COLLECTION col

JOIN CARD c ON c.cardID = col.cardID

WHERE col.userID = :userId

AND (:rarityOpt IS NULL OR c.rarity = :rarityOpt)

AND (:typeOpt IS NULL OR c.type = :typeOpt)

AND (:packOpt IS NULL OR c.packName = :packOpt)

AND (:nameSearchOpt IS NULL OR c.name LIKE CONCAT('%%', :nameSearchOpt, '%%'))

ORDER BY c.rarity, c.name;
```

Sample run:

```
SELECT c.cardID, c.name, c.rarity, col.quantity
FROM COLLECTION col

JOIN CARD c ON c.cardID = col.cardID

WHERE col.userID = 1 AND c.rarity = '1D'
ORDER BY c.name;
```

Expected output:

R7 - Basic Feature/Functionality 2: Add a card to my collection

R7-a:

This feature allows a user to add a card to their collection. The user is any logged-in user.

Flow: The user navigates to the "Add to Collection" page. They search for a Pokémon card by name, enter a quantity, and click "Add Card." If the card already exists in their collection, we increase the quantity. Otherwise, we add a new record. The app then displays a confirmation message and updates the visible collection table.

R7-b:

Query template:

```
INSERT INTO COLLECTION(userID, cardID, quantity, dateAcquired)
VALUES (:userID, :cardID, :quantity, NOW())
ON DUPLICATE KEY UPDATE quantity = quantity + VALUES(quantity);
```

Sampled query:

```
INSERT INTO COLLECTION(userID, cardID, quantity, dateAcquired)
VALUES (1, 'A1-035', 1, '2025-10-20 13:30:00')
ON DUPLICATE KEY UPDATE quantity = quantity + VALUES(quantity);
-- Verify
SELECT userID, cardID, quantity FROM COLLECTION WHERE userID=1 AND cardID='A1-035';
```

Expected output:

```
userID | cardID | quantity
-----1
1 | A1-035 | 1
```

R8 - Basic Feature/Functionality 3: Wishlist availability

R8-a:

This feature allows a user to see other users who have cards they want. The user is any logged-in player on their Wishlist page.

Flow: The page lists each wishlist card with Owners (count of distinct users other than the logged-in user who own ≥ 1 copy) and Total Copies (sum of those copies). Clicking a card reveals a modal with the list of owners' usernames.

R8-b:

Query template:

Sampled Query:

Expected output:

R9 - Basic Feature/Functionality 4: Find mutual trade matches

R9-a:

This feature allows a user A to find users B satisfying A wants X, B has X, B wants Y, and A has Y, with X and Y having the same rarity. The user is any logged-in user on the Find Matches page.

Flow: The user clicks Find Mutual Matches. The result cards show: Partner, They give \rightarrow I want, I give \rightarrow They want. Only pairs where both cards share the same rarity are shown.

R9-b:

Query template:

```
SELECT
 other.userID
                       AS partnerID,
 other.username
                       AS partnerName,
